技术规格

Background:	The muscarinic cholinergic receptors belong to a larger f amily of G protein-coupled receptors. The functional dive rsity of these receptors is defined by the binding of acet ylcholine and includes cellular responses such as adenylat e cyclase inhibition, phosphoinositide degeneration, and potassium channel mediation. Muscarinic receptors influe nce many effects of acetylcholine in the central and peri pheral nervous system. The clinical implications of this re ceptor are unknown; however, stimulation of this recepto r is known to increase cyclic AMP levels.
