Background:	This gene encodes a member of the retinoic acid (RA, a form of vit amin A) binding protein family and lipocalin/cytosolic fatty-acid bindi ng protein family. The protein is a cytosol-to-nuclear shuttling protei n, which facilitates RA binding to its cognate receptor complex and transfer to the nucleus. It is involved in the retinoid signaling pathw ay, and is associated with increased circulating low-density lipoprotei n cholesterol. Alternatively spliced transcript variants encoding the sa

me protein have been found for this gene.
