

兔抗 AZIN2 多克隆抗体

中文名称: 兔抗 AZIN2 多克隆抗体

英文名称: Anti-AZIN2 rabbit polyclonal antibody

别 名: antizyme inhibitor 2; ADC; AZI2; ODCp; AZIB1; ODC-p; ODC1L

相关类别: 一抗

储 存: 冷冻(-20℃)

宿 主: Rabbit

抗 原: AZIN2

反应种属: Human, Mouse

标 记 物: Unconjugate

克隆类型: rabbit polyclonal

技术规格

Background:

The protein encoded by this gene belongs to the antizy me inhibitor family, which plays a role in cell growth a nd proliferation by maintaining polyamine homeostasis within the cell. Antizyme inhibitors are homologs of orn ithine decarboxylase (ODC, the key enzyme in polyamin e biosynthesis) that have lost the ability to decarboxylas e ornithine; however, retain the ability to bind to antizy mes. Antizymes negatively regulate intracellular polyamine levels by binding to ODC and targeting it for degradation, as well as by inhibiting polyamine uptake. Antizyme inhibitors function as positive regulators of polyam

eir effect. This gene encodes antizyme inhibitor 2, the s econd member of this gene family. Like antizyme inhibit tor 1, antizyme inhibitor 2 interacts with all 3 antizymes and stimulates ODC activity and polyamine uptake. How ever, unlike antizyme inhibitor 1, which is ubiquitously e xpressed and localized in the nucleus and cytoplasm, a ntizyme inhibitor 2 is predominantly expressed in the b rain and testis and localized in the endoplasmic reticulu m-golgi intermediate compartment. Recent studies indic ate that antizyme inhibitor 2 is also expressed in specific cell types in ovaries, adrenal glands and pancreas, and in mast cells. The exact function of this gene is not k nown, however, available data suggest its role in cell growth, spermiogenesis, vesicular trafficking and secretion. Accumulation of antizyme inhibitor 2 has also been observed in brains of patients with Alzheimer's disease. The re has been confusion in literature and databases over the nomenclature of this gene, stemming from an earlier report that a human cDNA clone (identical to ODCp/AZIN2) had arginine decarboxylase (ADC) activity (PMID: 14738999). Subsequent studies in human and mouses howed that antizyme inhibitor 2 was devoid of arginine decarboxylase activity (PMID:19956990). Alternatively spliced transcript variants have been described for this gene. Applications: ELISA, IHC Name of antibody: Fusion protein of human AZIN2		ing levels by sequestering antingmes and neutralizing th
