### 技术规格

<b>Background:</b>	This gene encodes a member of the family of estrogen receptors and superfamily of nuclear receptor transcription factors. The gene product contains an N-terminal DNA binding domain and C-terminal ligand binding domain and is localized to the nucleus, cytoplasm, and mitochondria. Upon binding to 17beta-estradiol or related ligands, the encoded protein forms homo- or hetero-dimers that interact with specific DNA sequences to activate transcription.

<b>Name of antibody:</b>	ESR2(Phospho-Ser105)

<b>Immunogen:</b>	Peptide sequence around phosphorylation site of serine105(Q-R-S(p)-P-W) derived from Human Estrogen Receptor- beta.
