技术规格

Background:	Histone acetylation and deacetylation, catalyzed by multisubunit complexes, play a key role in the regulation of eukaryotic gene expression. The protein encoded by this gene belongs to the histone deacetylase/acuc/apha family and is a component of the histone deacetylase complex. It also interacts with retinoblastoma tumor-suppressor protein and this complex is a key element in the control of cell proliferation and differentiation.
Applications:	WB
Name of antibody:	HDAC1(Phospho-Ser421)
Immunogen:	Peptide sequence around phosphorylation site of Serine 421 (E-F-S(p)-D-S) derived from Human HDAC1.

Full name:	histone deacetylase 1
