技术规格

Background	Immunoglobulin G (IgG) is one of the most abundant proteins in se
	rum with normal levels between 9.5-12.5 mg/ml in adult blood. IgG
	is important for our defense against microorganisms and the molec
	ules are produced by B lymphocytes as a part of our adaptive imm
	une response. The IgG molecule has two separate functions; to bind
	to the pathogen that elicited the response and to recruit other cells
	and molecules to destroy the antigen. The variability of the IgG poo
	I is generated by somatic recombination and the number of specifici
	ties in an individual at a given time point is estimated to be 1011 $\ensuremath{\text{v}}$
	ariants.
Applications	Immune colloidal gold immunochromatography
