技术规格

Background:	This gene encodes an antigen that is preferentially expressed in human melanomas and that is recognized by cytolytic T lymphocytes. It is not expressed in normal tissues, except testis. The encoded protein acts as a repressor of retinoic acid receptor, and likely confers a growth advantage to cancer cells via this function. Alternative splicing results in multiple transcript variants.
Applications:	ELISA, IHC
Name of antibody:	PRAME

Immunogen:	Fusion protein of human PRAME
Full name:	preferentially expressed antigen in melanoma
